

Features Strongly Related to Life Expectancy

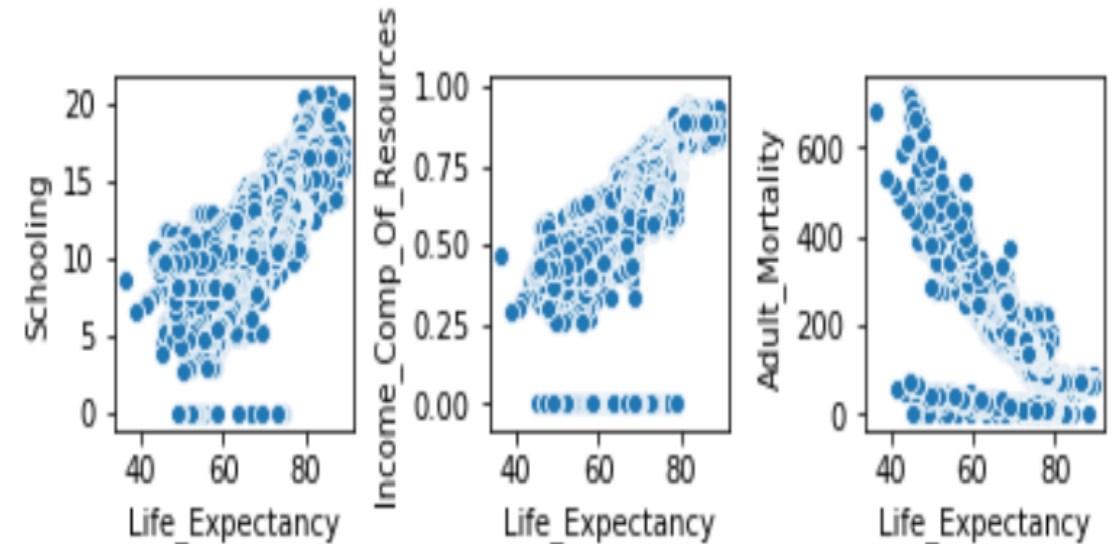

Joshua Young

9/3/2020

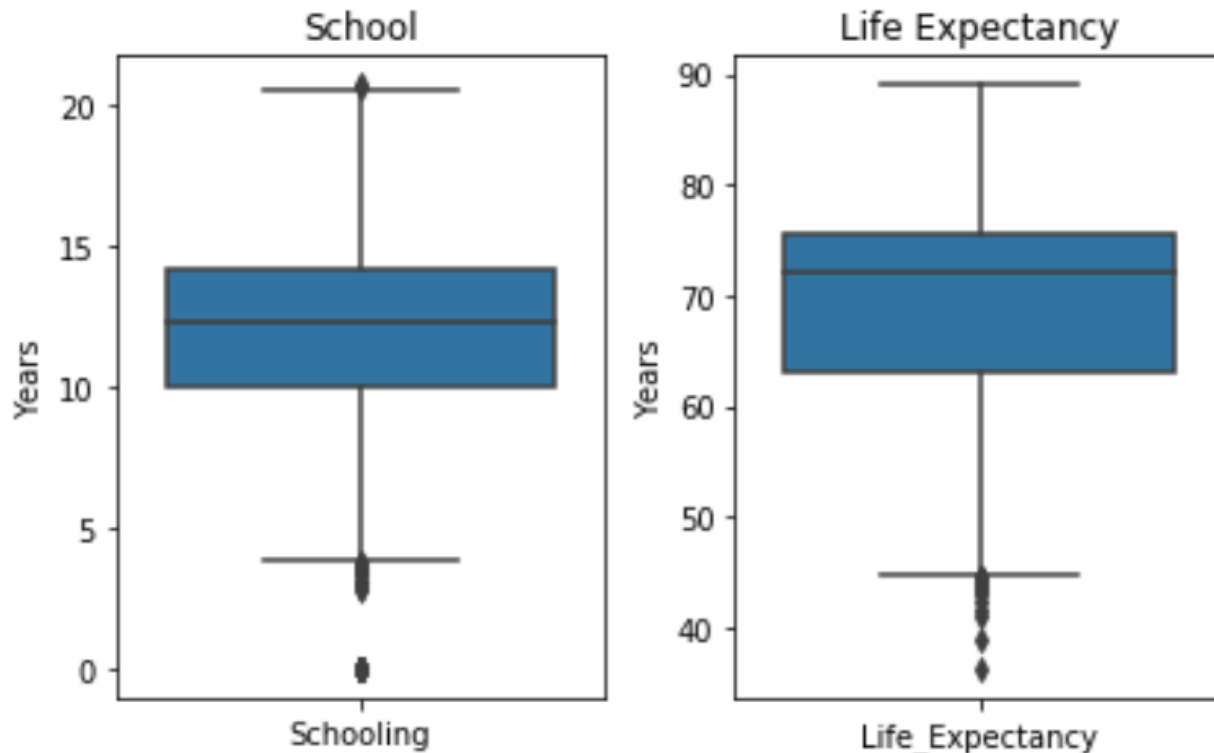

The more school an individual has and a countries ability to use resources has the highest likelihood of extending life compared to the other features in the study

Adult Mortality has the greatest negative effect on Life Expectancy

A masters degree has the potential of adding 27 years to your life.

- Average years in school: 12.3 Years
- Average life expectancy: 72 years
- Spend two years schooling after high school and anticipate adding 3.5 years to your life.

Countries who score above 81% on Income Composition of Resources have Life Expectancy above 79 years.

Of the top 10, Canada is the only developing nation.

Japan Leads the pack in Life Expectancy despite not being number one in either of the highest correlated features

Though Australia has leading numbers in both Schooling and ICOR it is number seven

The feature associated strongest with Adult Mortality is HIV/AIDS

Africa has the highest amount of HIV/AIDS and the country with the lowest Life Expectancy
